The Value of the EU Battery Passport

Executive Summary

An exploratory assessment of economic, environmental and social benefits

Version 0.9 / April 2024
DISCLAIMER

This document (the “Value Assessment of the Battery Passport – An exploratory assessment of economic, environmental and social benefits”) is for informational purposes only and is being made available to you by the Battery Pass consortium.

This Document is published by the Battery Pass consortium and contains information that has been or may have been provided by a number of sources. The findings, interpretations and conclusions expressed herein are a result of a collaborative process facilitated and endorsed by the Battery Pass consortium. The Battery Pass consortium partners (the partners as set out on slide 24 of this Document) endorse the overall project approach and findings and the Battery Pass consortium has made efforts to accurately capture stakeholder positions set out by organisations (including supporting partners and further experts), although the results may not necessarily represent the views of all individuals or the organisations they represent. The Battery Pass consortium has not separately verified the information provided from outside sources and cannot take responsibility if any of these statements misrepresent a stakeholder position or if positions evolve over time.

To the extent permitted by law, nothing contained herein shall constitute any representation or warranty and no responsibility or liability is accepted by the Battery Pass consortium as to the accuracy or completeness of any information supplied herein. Recipients of this Document are advised to perform independent verification of information and conduct their own analysis in relation to any of the material set out.

The statements contained herein are made as at the date of the Document. The Battery Pass consortium or any member, employee, counsel, offer, director, representative, agent or affiliate of the Battery Pass consortium does not have any obligation to update or otherwise revise any statements reflecting circumstances arising after the date of this Document.

This Document shall not be treated as tax, regulatory, accounting, legal, investment or any other advice in relation to the recipient of this information and this information should not and cannot be relied upon as such.

If you are in any doubt about the potential purpose to which this communication relates you should consult an authorised person who specialises in advising on business to which it relates.

The EU battery passport could create value for business, authorities and consumers – but to fully leverage its potential, interventions beyond regulation are needed

- The battery passport as per the Battery Regulation promises to enable several direct use cases, in particular for circular management of batteries downstream of manufacturing – additional specifications of voluntary data attributes, implementation of upstream traceability, integration in regulated downstream processes and systems, and aggregation of data attributes from different battery passports could expand value creation by enabling additional potential use cases

- We assessed the benefits of the battery passport along twelve use cases qualitatively with a deep dive including an initial quantitative assessment on three selected use cases to understand where and how battery passport data could lead to more efficient operations, product differentiation, and a digital and green market

- Companies along the battery value chain should consider battery passports as a strategic opportunity to generate value. We find that:
  - Information availability through the battery passport could increase the credibility and reliability of supply chain data and green claims for product differentiation, enable informed purchasing decisions, ease servicing, improve used battery transport risk assessment, streamline the trade of used batteries, enable industry benchmarking and an accurate market overview
  - Performance data could simplify the residual value determination and reduce procurement including technical testing costs for independent operators by ~ 2-10%.
  - Composition and dismantling information could make the recycling process more efficient and reduce the costs for pre-processing and subsequent treatment in recycling by ~ 10-20%

- The regulator should facilitate the realisation of this value by creating conducive conditions and by offering targeted support to companies struggling with capacity. To fully materialise the value creation potential of the battery passport, we recommend:
  - The battery passport should be integrated wherever possible into existing regulatory procedures and systems, e.g. Green Public Procurement. Additionally, reported battery passport information should be leveraged for the design of upcoming policies and policy changes.
  - Additional data attributes should be allowed in a separate “beyond regulation” battery passport section to enable the battery passport being used as a B2B tool.
  - The battery passport should be used in vehicle de-registration and export procedures, which could lead to more secondary active materials becoming available, potentially fulfilling ~ 5-20% of material demand for projected European passenger vehicles in 2045.

- Consumers could benefit from battery passport information through informed purchasing decisions and residual value determination improvements. The benefits of the battery passport and data need to be communicated effectively to motivate consumer engagement.
The battery passport, a breakthrough EU innovation, is actively supported by the Battery Pass consortium, which aims to create resources facilitating its implementation.

The **battery passport** is a breakthrough EU innovation to digitally support sustainable, circular, high-performing batteries.

- A **digital product passport** (DPP) is a novel concept making available comprehensive life cycle information of a physical product in digital format introduced by the European Union as part of its broader regulatory ambition towards sustainability and a digitalised economy.
- The battery passport will be **required from February 2027 onwards** by the EU Battery Regulation, encompassing around 90 data attributes from seven content clusters for electric vehicle (EV), light means of transport (LMT) and industrial batteries with a capacity > 2kWh.
- Next to the European Union, similar (regulatory) efforts on the introduction of a digital product or battery passport are **ongoing globally**.

The **Battery Pass consortium** set out to create resources that support the implementation of the EU battery passport by industry:

- The “Battery Pass” is a consortium of 11 partners from industry, science, technology and beyond, co-funded by BMWi **aiming to advance the implementation of the EU battery passport** and therefore also collaborating with other major initiatives in the DPP space (e.g. CIRPASS, GBA, Catena-X).
- Initiated and led by the systems change company Systemiq, the Battery Pass works to create **industry guidance** on content requirements, the **technical reference framework** for DPP, a **software demonstrator**, and a **value assessment**.
- This document presents the first of two publications addressing the value assessment and focuses on **modelling the benefits of individual use cases qualitatively and quantitatively** (illustrative).
The value assessment represents a collaborative effort of the Battery Pass consortium that covers a comprehensive scope and is validated by external stakeholders.

### Scope of the assessment and methodological process

<table>
<thead>
<tr>
<th>Requirements</th>
<th>Value</th>

</tbody>
</table>

### Battery Pass consortium partner perspective
- 15 Consortium group meetings
- 6 Sub-working groups

### External battery industry perspective
- >30 Expert interviews
- 2 Public consultations

- The value assessment was led by Systemiq in a collaborative effort with the Battery Pass consortium and validated by external stakeholders to incorporate the perspective of the entire battery value chain.
- The scope includes mandatory requirements as well as voluntary additions and differentiates between benefits and drawbacks in three impact dimensions (economic, environmental and social).
- While all battery categories requiring a passport are included in the overall assessment, the deep dives focus on EV batteries, and a separate analysis highlights differences for industrial batteries.

¹ As per the EU Battery Regulation
Benefits of the battery passport will arise throughout the battery value chain, though particularly during a battery’s service life

Overview of benefits and use cases

- The battery passport provides **added value** compared to the general reporting requirements from the Battery Regulation by **collecting data in a digital format and making it securely accessible** to users with the respective access rights.

- So called “**use cases**” describe processes which could be improved by using the battery passport and are **identified to understand** which economic, environmental and social benefits arise by using the passport.

- We identified and qualitatively described **twelve battery passport use cases** along the value chain, of which we **assessed three in further detail** qualitatively and quantitatively.
  - Seven “**direct**” use cases result from **mandatory data attributes** required by the EU Battery Regulation in combination with their respective access rights.
  - Five “**potential**” use cases could be enabled provided certain **conditions** are in place which would go **beyond current regulatory requirements**.
Seven direct use cases are enabled by mandatory data attributes and their respective access rights - they unlock value along the downstream value chain.

Direct use cases

Benefit: Economic, Environmental, Social
Level of benefit: Low, Middle, High

Distribution of direct use cases along the value chain

- Mining
- Refining
- Precursor and CAM production
- Recycling: E
- Collection: D, F
- Re-use, Remanufacture or Repurpose: B, C, F, G
- Usage: B, C, F, G
- Pack assembly and integration: A

Direct value add along several dimensions (environmental, social and economic)
Two deep dives indicate that the battery passport could lead to significant cost savings for recyclers and second-life operators as well as substantial environmental impact reduction.

**Deep dive use case E: More efficient recycling processes**

- Data available from the battery passport could **enable recycling process improvements** leading to economic (pre-processing and recycling cost reduction), environmental (secondary material increase, CO₂ reduction) and social (health and safety improvements) benefits.

- An initial quantification of potential improvements of the mechanical-hydrometallurgical process route, indicates that composition and dismantling data might **decrease recycling costs for pre-processing and treatment** by ~10-20% based on current generic recycling cost estimations for NMC batteries.

- Additionally recovered active materials could meet up to 25% of the difference between the technically possible maximum recovery rates and recovery rate targets from the battery regulation.

**Deep dive use case F: Simplified residual value determination**

- Historic performance and durability information available through the battery passport could **improve the residual value determination process** by reducing the need for technical tests and improving the accuracy of the assessment. Thereby, decisions between second-life and recycling could be facilitated.

- An initial quantification of the residual value determination process for three different battery sourcing scenarios shows that through avoiding technical tests, ~2-10% of the procurement including technical testing costs could be reduced for independent second-life operators.

- Due to the decrease of costs, we estimate a proportional increase in batteries going into second-life, which could fulfil ~6-20% of the demand for stationary battery energy storage in Europe.

---

**Recycling costs reduction through the battery passport**

<table>
<thead>
<tr>
<th>Scenario</th>
<th>Baseline</th>
<th>Reduced sampling</th>
<th>Improved dismantling</th>
<th>Automated dismantling</th>
<th>Reduced treatment cost</th>
<th>Recycling cost with battery passport</th>
</tr>
</thead>
<tbody>
<tr>
<td>Min</td>
<td>~12%</td>
<td>~12%</td>
<td>~6%</td>
<td>~6%</td>
<td>~4%</td>
<td>~8%</td>
</tr>
<tr>
<td>Max</td>
<td>~12%</td>
<td>~12%</td>
<td>~6%</td>
<td>~6%</td>
<td>~4%</td>
<td>~8%</td>
</tr>
</tbody>
</table>

**Second-life procurement and technical testing costs reduction through the battery passport**

- **Inhouse sourcing**: Reduced costs due to no testing required, and thus, no improvement potential.
- **Direct sourcing**: ~2% reduction in costs, with a ~2% increase in technical testing.
- **Indirect sourcing**: ~4% reduction in costs, with a ~4% increase in technical testing.

Conditions beyond regulatory requirements (upstream traceability, integration into official downstream processes and aggregated data) could enable five potential use cases

<table>
<thead>
<tr>
<th>Conditions required beyond regulatory requirements</th>
<th>Use case</th>
<th>Benefit</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Application of traceability systems for data collection</strong>&lt;br&gt;The Battery Regulation and passport data requirements increase the need for reliable and credible data in upstream value chains. This could be enabled by gathering the data via traceability systems which, when complementing battery passport solutions, could unlock another use case through optimising data processing and use.</td>
<td><strong>Efficient data exchange and reporting based on upstream traceability</strong></td>
<td>![Benefits](Economic, Environmental, Social)</td>
</tr>
<tr>
<td><strong>Integration into official downstream processes</strong>&lt;br&gt;To ensure battery collection, additional information on the downstream status as well as integration into official processes such as export control are needed. This would unlock another use case.</td>
<td><strong>Increased end-of-life collection</strong></td>
<td>![Benefits](Economic, Environmental, Social)</td>
</tr>
<tr>
<td><strong>Aggregation of data from different passports</strong>&lt;br&gt;Aggregation of data from different battery passports, solved through an EU Commission-provided infrastructure or managed by specialised service providers, could provide additional information on market or organisation level and thereby unlock further use cases.</td>
<td><strong>Industry benchmarking</strong></td>
<td>![Benefits](Economic, Environmental, Social)</td>
</tr>
<tr>
<td></td>
<td><strong>Accurate market overview</strong></td>
<td>![Benefits](Economic, Environmental, Social)</td>
</tr>
<tr>
<td></td>
<td><strong>Informed policy design</strong></td>
<td>![Benefits](Economic, Environmental, Social)</td>
</tr>
</tbody>
</table>
The third deep dive highlights the potential for a substantial macroeconomic benefit of the passport by leading to more secondary material available on the European market

Deep dive use case I: Increased end-of-life collection

- Integration of the battery passport into regulated downstream processes with additional data attributes could support authorities in identifying and thereby reducing illegal exports and illegal treatment. This would result in benefits such as increased supply security, recycling revenue increase, health and safety, as well as reduced emissions.
- An initial quantification shows that a reduction of battery leakage through the battery passport could lead to more secondary active materials available that could fulfil ~5-20% of projected European passenger EV demand in 2045.
- Moreover, the additional availability of secondary active material in the EU market could increase recycling revenue by ~5-15% and cause a ~2-10% reduction of carbon emissions associated with raw material extraction of active materials required to meet EV battery demand.
A separate analysis for industrial batteries shows the applicability of all use cases while highlighting differences due to technological, usage, and business characteristics.

The added value is strongly affected by industrial batteries’ different applications and characteristics:

- Differing characteristics and use patterns of industrial applications (e.g. energy storage, electric logistics solutions, heavy duty) as well as correspondingly varying business processes reduce benefits.

- The broad range of technologies/chemistries (Li-ion, Pb-acid, Ni-based or redox-flow) used in industrial batteries introduces specific characteristics that distinguish the value assessment for subgroups of industrial batteries.

- Benefits associated with detailed dynamic battery passport data are not applicable to industrial batteries without battery management system/connectivity.

BatteryPass | thebatterypass.eu | 11 |
We acknowledge that the battery passport also presents challenges that could lead to drawbacks diminishing the overall value when unmitigated, which we will assess further.

Challenges and drawbacks

- While unmitigated challenges may decrease the passport’s overall value, the benefits derived from above explained use cases are expected to outweigh the drawbacks.
- Technical and battery passport system challenges are expected to mostly affect the passport issuer and require industry collaboration, investment in emerging technology and authority support in enforcing standards.
- Capability and resource challenges are estimated to mainly impact SMEs and necessitate early intra-organisational alignment, harmonised requirements and financial support.

Outlook

The Battery Pass consortium will continue the value assessment by assessing challenges and drawbacks in more detail, considering systemic perspectives and quantifying cumulative benefits.
Thank you!
